NEW DOUBLE STARS

Discovered by: Rene Gili using the speckle camera PISCO 2 attached to the 76 cm refractor of the Cote d'Azur Observatory

All measurement was done by Speckle Interferometry and also for some of them using Lucky Imaging noted as LY in column 8 (M).

ANNOUNCEMENTS

WEBSITE MIRROR

Due to difficulties of some users reliably accessing the catalogs and ancillary double, binary and multiple star information maintained at the U.S. Naval Observatory we have established a mirror site at Georgia State University. Specifically :

- The Washington Double Star (WDS) Catalog: `http://www.astro.gsu.edu/wds/`

- Sixth Catalog of Orbits of Visual Binaries:
  `http://www.astro.gsu.edu/wds/orb6.html`
- Catalog of Rectilinear Elements: `http://www.astro.gsu.edu/wds/lin1.html`
- Fourth Catalog of Interferometric Measurements of Binary Stars:
  `http://www.astro.gsu.edu/wds/int4.html`
- The Third Photometric Magnitude Difference Catalog:
  `http://www.astro.gsu.edu/wds/dm3.html`
- Double Star Library (webpage of former IAU Commission 26: Double and Multiple Stars):
  `http://www.astro.gsu.edu/wds/dsl.html`
- IAU Commission G1 (Binary and Multiple Stars) Webpage:
  `http://www.astro.gsu.edu/wds/bsl/`

Doug Gies and Justin Cantrell (GSU) are thanked for hosting the mirror and for their aid in enabling it. Due to IT/IA restrictions, updates cannot be automatically made but will be made as frequently as possible. Finally, there will inevitably be a few problems with incorrect links, etc., and we would appreciate notification of any missing or incorrect items you may run across.

Brian D. Mason

NEW CANDIDATE COMPANION TO EXOPLANET BINARY STAR WASP-85 (BU 793 AB)

BU 793 (WDS 11436+0634), WASP-85, is a visual binary system, about 125-150 pc distant, composed of solar-type stars (G5V and K0V) with V magnitudes of 10.9 and 11.6, and separated by 1.5 arcseconds. It was discovered in 1881 and has 24 astrometric measurements listed in the WDS catalog. WASP-85 A hosts an inflated transiting hot Jupiter (WASP-85Ab) discovered by Kepler satellite in 2014. The planet, with 1.27 Jupiter mass, orbits with a semimajor of 0.039 AU and with an orbital period of 1.4786 days.

The binary system WASP-85 has a moderate proper motion of $\mu(\alpha)$ = -80.9 ± 1.9 and $\mu(\delta)$ = +10.6 ± 1.8 mas yr^{-1} (Tycho-2) and the stellar components WASP-85 A and B have common radial velocities (Vrad(B) - Vrad(A) = -0.57 ± 0.04 km s^{-1}). Our preliminary dynamical study strongly suggests that WASP-85 is a gravitationally bound binary system.

Manuel J. del Valle found the star 2MASS J11434596+0635056, with V = 16.36 (APASS catalog) and proper motion of $\mu(\alpha)$ = -87.0 ± 3.8 and $\mu(\delta)$ = +12.2 ± 3.8 mas yr^{-1} (PPMXL) at 141″ separation at direction 57.2 degrees from WASP-85. From multi-band photometry (JHK from 2MASS, BVgri from APASS and ugriz from SDSS), it is a M2.5V star at about 130 pc. The common proper motion and common distance suggest that it could be a new physical companion to the exoplanet host binary star WASP-85, converting it in one of the few triple systems hosting planets.

Manuel J. del Valle & Francisco Rica
